(54) HYDROPHILIC MEMBRANE AND ITS PRODUCTION

(57) Abstract:

PURPOSE: To obtain the title membrane which contains no soluble component and can be used immediately, by introducing a hydrophilic component into a membrane based on a hydrophobic polymer and water-insolubilizing this component by radiation and/or heating.

CONSTITUTION: A hydrophilic component (e.g., collagen) is introduced into a hydrophobic membrane based on a hydrophobic polymer (e.g., PP) and having an equilibrium moisture content (as measured after being stored in an atmosphere at 20°C and an RH of 65% for one week, weight of water/weight of polymer) ≤5%, preferably, ≤2%, and this membrane is irradiated with a radiation (e.g., γ-rays) and/or heated to 50W200°C to insolubilize the

f e e

hydrophilic component.
